GENERAL SECTION

SAFETY PRECAUTIONS

The following check should be performed for the continued protection of the customer and service technician.

LEAKAGE CURRENT CHECK

Before returning the unit to the customer, make sure you make either (1) a leakage current check or (2) a line to chassis resistance check. If the leakage current exceeds 0.5 milliamps, or if the resistance from chassis to either side of the power cord is less than 460 kohms, the unit is defective.

Handling instructions

This model is assembled and precision adjusted in maker's plant. Never attempt to disassemble or readjust it. Follow the instructions below when handling.

1. General

(1) Storage

Store and transport this model with the +Z axis pointing up or +Y axis pointing down. (See Fig. 1.)

Avoid storing the KSM-213 series in hot, humid or dusty conditions.

(2) Handling

This model is a precision unit. Be careful not to subject it to shocks by dropping or rough handling.

2. Laser diode

(1) Shield your eyes from the laser beam

The output from the LD is only 400 μ W maximum after going through the objective lens. However, the intensity of the focused beam reaches about 0.7×10^4 W/cm^3. Never look directly into the LD or observe the laser beam through another lens or mirror. If you need to view the beam, use an infrared viewer or an ITV camera.

(2) Toxicity of As

The LD chip is manufactured from GaAs and GaAlAs, which contains toxic As(Arsenic). The toxicity of As in this form is far lower than other As compounds such as As_2O_3 and $AsCl_3$, and the As content of one chip is very small.

However, avoid putting the chip in an acid or alkali solution, heating it over 200°C, or putting it your mouth. Defective LDs from the production line and parts removed in servicing should be disposed of with due care.

(3) Avoid current surges and electrostatic discharges

The LD may deteriorated if its output is too high and damage may occur if it is exposed to large currents for even a short time. Protect the LD drive circuit from current surges caused by switches or other sources. An electrostatic discharge from the human body may destroy the LD instantaneously if it is handled carelessly. LD terminals are factory strapped before shipment to protect LD from electrostatic discharges during transportation. For safe handling of the LD, ground your body, measuring equipment, jigs, and tools during installation. Use of a grounding mat on the workbench and floor is recommended. After connector insertion, unstrap the LD terminal with a soldering iron with its metallic tip grounded or worse insulation resistance is 10 megaohms or more (at 500V DC) five minutes after it is tuned on. The temperature of the soldering iron tip must be 320°C or below (30W) and the unstrapping should be performed quickly.

3. Actuator

(1) Actuator

The performance of the actuator may be affected if a magnetic material is located nearby, since the actuator has a strong magnetic field. Do not allow foreign materials to enter through gap in the cover.

(2) Lens cleaning

Dust or dirt on the objective lens has an adverse affect on pick-up performance. Gently wipe the lens using tissue moistened with isopropyl alcohol.

4. Lubrication

This drive unit need no lubrication when installed nor during use. Should lubrication become necessary use only grease "G-474B" or "G-474BY"(KANTO KASEI KOGYO) in the feedbearings and in the feed mechanism. Other types of oil or grease must not be used!

5. Handling

Hold the diecast chassis when handling the drive unit. Note that the LD and PD may be damaged if you come in contact with any of circuit boards.

Precautions in use

1. APC Circuit

The output laser power must be controlled with the built-in monitor photodiode, since laser power changes with temperature. To prevent the characteristics dispersion of the monitor photodiode, the relation between the potentiometer(VR) attached to the pick-up and the monitor photodiode is factory adjusted so that the RF output will be constant.

2. Connections

Use the specified connectors for electrical connections. The eye pattern may deteriorate if a digital noise source such as a microcomputer is positioned near the harness from the photodiode. The laser may deteriorate if the actuater or laser diode connection is poor, securely connect these connectors.

ADJUSTMENTS

Adjusting and Checking the Mechanism Section

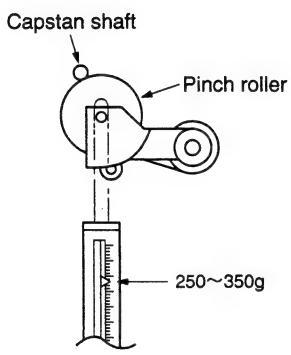
1. Replacement of the pinch roller

Before replacing the pinch roller, clean the tape contact surface of the pinch roller and the tape contact surface of the capstan shaft. After replacement, run a C-90 tape without a pad and check for the presence of tape curl at the tape guide portion of the head.

2. Checking the pinch roller pressure

Set to the playback condition and hook a bar-type spring scale to the bracket above the center line of the pinch roller. Pull the pinch roller away from the capstan shaft, then allow the pinch roller to come into contact with the capstan shaft and check that the reading of the bar-type spring scale is between 250 g and 350 g when the pinch roller starts to rotate.

Replace the pinch roller when the value falls outside of the specified range.



3. Replacement of the recording/playback head assembly

Perform this procedure after removing the front panel.

3-1 Removal of the head assembly

(1) Remove the 2 head base fastening screws.

(2) Remove the head base from the reed holder and the wire connector.

3-2 Mounting the recording/playback head assembly

Perform by following the steps of Section 3-1 Removal of the head assembly in reverse.

4. Adjustment of the recording/playback head

Azimuth adjustment

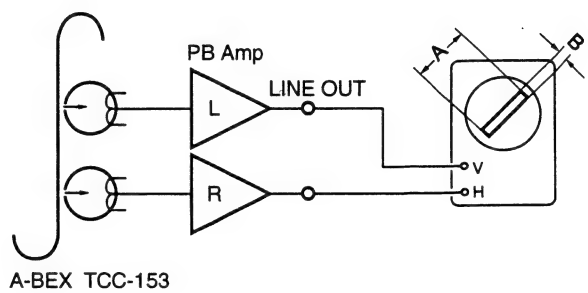
Load side A of the A-BEX TCC-153 test tape facing forward, and adjust.

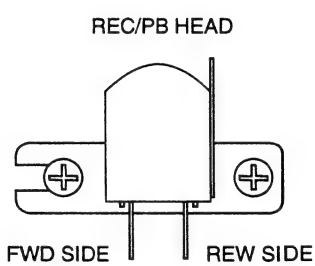
(1) Play in the FWD direction and turn the azimuth adjustment nut for the FWD side so that the Lissajous¢s figure becomes maximum at (A) and minimum at (B).

(2) Play in the REW direction and turn the azimuth adjustment nut for the REW side as adjusting the FWD side method.

(3) Adjust (1) and (2) again.

(4) Apply screw lock to the adjustment locations.





5. Checking the winding torque

Load a cassette type torque meter (Sony TW2111A at the FWD side) and check that the reading of the torque meter during playback is 30 to 70 g-cm at the center value.

When outside of the specified value range, check the voltage of the reel motor (approx. 4 V). When the voltage value is low, the torque is weak, and when when high, the torque is strong.

CASSETTE DECK

6. Checking the back tension torque at the time of recording and playback

Load a cassette type torque meter (Sony TW2111A at the FWD side) and check that the reading of the torque meter during playback is 1.5 to 6 g-cm and that there is no unevenness.

7. Checking the FF and REW torque

Load a cassette type torque meter (Sony TW2231) and check that the value indicated by the torque meter for winding and rewinding is between 70 and 150 g-cm.

8. Checking the FF and REW time

Load a DENON HD-X/60 cassette tape, and check that the time for FF and REW is below 120 seconds. When outside of the specified range, check Steps 5 and 6.

9. Checking the erroneous erasure prevention, and the metal and chrome switch operations

Check that detection lever is operating the switch properly depending upon the presence or absence of a hole.

Adjusting and Checking the Electrical Section

Measuring instruments needed for the adjustments

(1) Low frequency oscillator
(2) Variable resistance attenuator
(3) Electronic voltmeter
(4) Oscilloscope
(5) Frequency counter
(6) Adjustment screwdriver
(7) 4-sided adjustment rod for trap coil adjustments
(8) Test tapes
(Sony TY-224)
(A-BEX TCC-153, TCC-130, TCC-262B/162B)
(DENON HD-X/60)
(9) Mirror cassette for the transport (A-BEX TCC-902)

Adjustment precaution

(1) Before adjustments, use gauze or a swab moistened with alcohol to wipe the surface of the heads, the capstan shaft, and the pinch roller.
(2) Demagnetize the record/playback head and the erase head with a head eraser.
(3) Completely demagnetize the driver to be used for the adjustments.
(4) Unless otherwise specified, set the various operation controls as indicated below.
REC level: Center
Dolby NR switch: Off

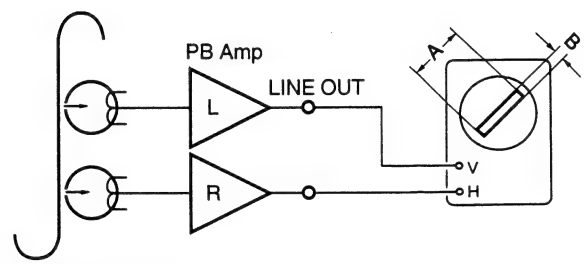
1. Tape transport check

Load the mirror cassette for the transport, and illuminate the area around the fixed guide of the record/playback head with a lamp and observe.
Check that the tape edge is not hitting the tape guide portion.
Note that the tape transport is the greatest factor affecting the performance of the cassette deck. Never move the inspection locations without good reason.
For information about replacement and adjustment of the record/playback head, see the section ²Adjustment and checking of the mechanism².

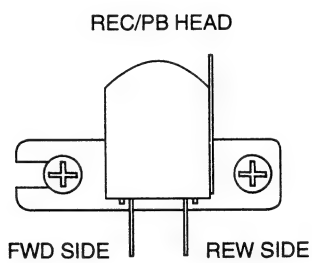
2. Azimuth adjustment

2-1 After making the tape transport check, load the test tape (A-BEX TCC-153).

2-2 Play back the test tape and turn the azimuth adjustment nut so that the Lissajous¢s figure becomes maximum at (A) and minimum at (B).



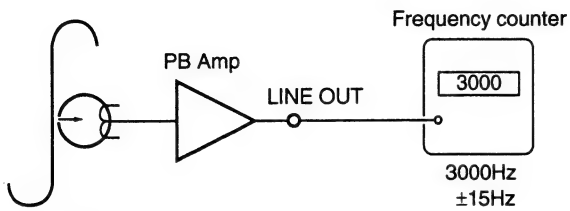
A-BEX TCC-153



3. Tape speed check and adjustment

3-1 Connect the frequency counter to the LINE OUT pin and load the test tape (Sony TY-224).

3-2 Playback a test tape. At about halfway through the tape, where the tape transport is stable, confirm that the frequency counter will have a reading within the range of 3,000 Hz ±15 Hz.



SONY TY-224

4. Adjustment of the playback system

4-1 Playback level

Play back the test tape for the Dolby standard level (A-BEX TCC-130), and adjust VR301L (Left channel) and VR301R (right channel) so that the level of the LINE OUT pin becomes –5.7 dBm (400 mV). (Load resistance of 47 kohm)

4-2 Checking the playback frequency respones

Play back the test tape (A-BEX TCC-262B/162B), and check that the frequency response satisfies the standard.

NOTE After making the azimuth adjustment with the 8 kHz at the start of the A-BEX TCC-262B test tape, perform check of the frequency respones.
Also, after the check make an azimuth adjustment again with A-BEX TCC-153, then apply screw lock.

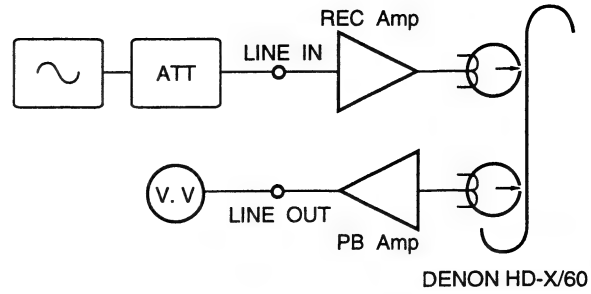
5. Adjustment of the recording system

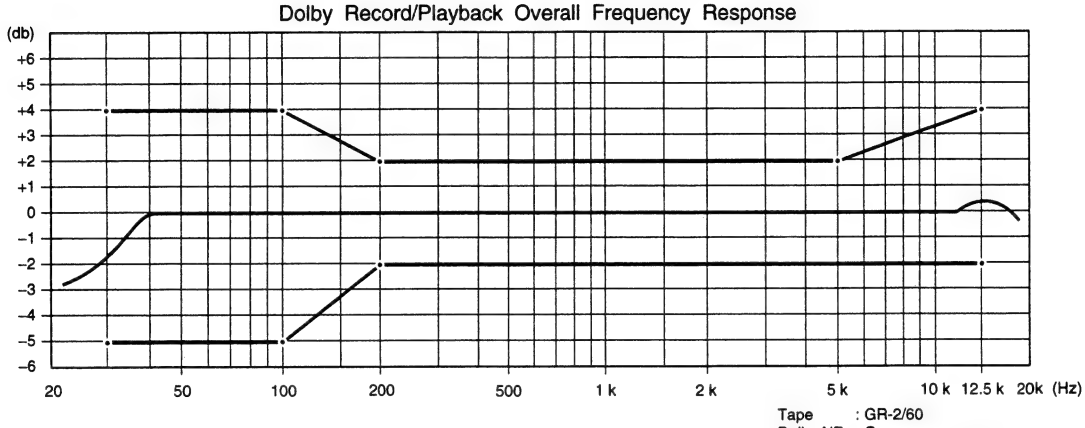
5-1 Adjustment of the recording and playback overall frequency respons

(1) Load the DENON HD-X/60 test tape, record a signal of-20 dBm (30mV) 1 kHz input level, and play back.

(2) Set the input signal to 10 kHz, record, and play back. Adjust VR2L (left channel) and VR2R (right channel) so that the response specifications of the diagram below are satisfied with respect to the 1 kHz output level.



Dolby Record/Playback Overall Frequency Response



Tape : GR-2/60
Dolby NR : On
Level : −20dB From Dolby Level

5-2 Adjustment of the recording/playback level

(1) Load the DENON HD-X/60 test tape, record a signal of 1 kHz (−20 dBm), and play back.

(2) Adjust VR1L (left channel) and VR1R (right channel) so that the output of the LINE OUT pin becomes the same as the output at the time of the recording monitor.

5-3 Checking the Dolby C recording and playback overall frequency response.

(1) Set the Dolby NR switch to the "C" positions.

(2) Use the DENON HD-X/60 test tape to record and play back according to the outline of Section 5-1, then check that the response specifications have been satisfied.
